AutoCAD [Mac/Win] [Latest]

Layout features AutoCAD's layouts feature, built on its solid modelling foundation, is intended to make it easier to layout and design assemblies and other geometric objects from a CAD file. A layout can be created from an AutoCAD drawing, a drawing from a DWG file, or a DXF file. It consists of a basic sheet with many layout tabs, which can be customized. With the ability to create multiple layouts, a user can create a plan view layout and a sheet view layout, for instance, and place the sheet in a specific spot on a D-Base or paper design surface. Features of AutoCAD's layout include basic drawing tools such as various kinds of shapes, drafting guides, dimensions, and text; methods for inserting objects into the layout, such as tabs and frames; and advanced features, such as node-based layout and bubble diagrams. Each tab contains its own set of layout parameters, which are configuration settings for the tab. The number of tabs is not limited. For example, a layout can have tabs for common block selection, block insertion, drawing tools, dimensioning, or text. In addition, each layout tab has its own set of properties, which are configuration settings for the tab. The number of properties for each tab can be configured, and are listed at the bottom of the properties dialog. The software supports both master and slave layouts. A master layout is the original layout. A slave layout is the copy of the master layout. There are many methods of using slave layouts in AutoCAD. Other features AutoCAD supports different types of brushes and stamps. These include a standard brush and a drawing customizer brush. A brush is an area of a drawing that has an associated graphic. These area graphics (e.g., solid, dashed, gradient and hatch) can be modified with the brush. A custom brush is a custom graphic that can be created with a CAD feature. A custom stamp is an

image used for drawing or editing features (e.g., splines, lines, polygons, text, dimensions, and a few others). A "Design" option is available in the preferences dialog, which is a shortcut to the "Create Drafting Templates" feature. AutoCAD provides templates that can be used to create a new drawing, a view, an annotation, or a legend. The templates can be edited using the "Edit Template" dialog, which has a list of available templates a1d647c40b
